

Design Intent

Design Intent

Initial Idea

Written by me explanation

The following app serves as a habit builder for its users. It is a way to organize daily habits that they want to incorporate in their lives in a todo list that refreshes daily. Users can separate their habits into different categories of their choosing (Example: Morning habits, Finance habits, Fitness habits.) Habits and categories should be completely editable by users based on their needs and what they're building. The app must keep track of the user's streak based on habit completion. At the same time, each task should give user points that they can use to buy themselves different types of pleasures that they're trying to avoid (Example: Treat from the bakery, Night out, etc.) Finally, the platform should allow users to set their own "pleasures," including the price of each. The design should work on both desktop and mobile for easy accessibility.

AI assisted Explanation

Dino Days (Changed to Ritual) is a habit-building platform designed to help users cultivate consistency through structure, accountability, and intentional reward. At its core, it functions as a daily to-do list that resets every morning — giving users a clean slate while maintaining a continuous record of their progress over time.

Users can organize their habits into fully customizable categories of their choosing, such as Morning Routine, Fitness, Finance, or Mindset. Both categories and individual habits are entirely editable, allowing the platform to adapt to each user's evolving goals and lifestyle.

Every habit completed earns the user a set number of points, which accumulate over time and can be spent on personal pleasures — indulgences the user has decided to earn rather than consume freely. These might include a treat from a favorite bakery, a night out, or a lazy Sunday with no obligations. Users define their own list of pleasures and set the point value for each, creating a reward system that is entirely personal and self-motivated.

The platform also tracks streaks based on daily habit completion, giving users a tangible measure of their consistency and a reason to keep showing up. The longer the streak, the greater the sense of momentum.

Dino Days is built to be fully accessible across both desktop and mobile, so users can check in and complete habits wherever their day takes them.

Color Palette

D0B8AC Almond Silk	F3D8C7 Powder Petal	EFE5DC Linen	FBFEFB Porcelain	FFFFFF White
--	---	------------------------------------	--	------------------------------------

Color Variations

D0B8AC Almond Silk	F3D8C7 Powder Petal	EFE5DC Linen	FBFEFB Porcelain	FFFFFF White
--	---	------------------------------------	--	------------------------------------

B3AAC4	D2C6DF	DEDAE5	F2F2F2	FFFFFF
-------------------	-------------------	-------------------	-------------------	-------------------

A9C1C9	C7DEE5	DCE7EA	F9F8F7	FFFFFF
-------------------	-------------------	-------------------	-------------------	-------------------

B1C6A8	D2E5C8	E1E8DC	F7F7F7	FFFFFF
-------------------	-------------------	-------------------	-------------------	-------------------

Users should be allowed to choose the color of their UI based on preference. They should be able to choose it from the onboarding process, however, it should allow them to change it from the account settings.

UI Reference Examples

Typographic Elements

Typefaces

Fraunces Optical serif, used for all display and heading text. Warm, editorial, slightly literary. Weights used: 300, 400, 500, 600, 700, and italic 400.

DM Sans Geometric sans-serif, used for all body text, UI labels, and interactive elements. Weights used: 300, 400, 500.

Text Colors

#1d1e1e

#5a5550

#9a908a

#FFFFFF

Visual Hierarchy

Ritual uses a three-level ink system to establish reading priority on every screen: ink (#1d1e1e) for primary content that demands attention, ink-soft (#5a5550) for supporting descriptions and secondary labels, and ink-faint (#9a908a) for metadata and contextual information the user references but doesn't need to read urgently. Moreover, scale reinforces this by using Fraunces at 44px (anchors the most important number on any screen; streak count, points total), and DM Sans at 11-13px with uppercase tracking and letter-spacing. Furthermore, surface elevation creates depth through three distinct background layers: the warm linen-to-powder gradient for hero moments that frame the user's current status, white cards with a 1px warm border for content containers, and the single dark gradient surface on the Rewards header to signal currency and premium weight. Spacing follows Gestalt proximity: section labels sit 14px above their group and 8px below it, so they belong visually to what follows rather than what precedes. No element uses all three emphasis tools simultaneously; something is either large, or dark, or on a warm surface (never all three at once,) which keeps the system from feeling heavy.

General UI

I want the UI to be modern and minimalist. All colors should be more on the light mode spectrum, however, some elements should change on dark mode. The menu bar should hold four elements for my four screens and it should be easy to navigate and user friendly. Additionally, users should be able to change their account settings and other elements. It should make use of phone emojis, icons and other visual elements.

Screen 1 (TODAY)

Habits

The Today screen should include a card greeting the user (Good morning, Good afternoon, or Good evening) with a short motivational line beneath it. Below the hero, a row of pill-shaped chips shows the user's current streak, total points, and today's completion count. Additionally, there should be a thin progress bar beneath that tracks how far through today's habits the user has gotten. Habits should be grouped by section and rendered as tappable rows. They should each include a circular completion button on the left, the habit emoji and name in the center, and its point value on the right. Completing a habit fills the circle and awards points in real time.

Habit Filters (Section Tabs)

These should be a scrollable row of pill tabs between the stats row and the habit list. The "All" tab always appears first, followed by one tab per section the user has created. The active tab fills dark with white text; inactive tabs are outlined only.

Adding a Section

Sections are created through the Task Manager, which opens from the pencil icon in the header. Inside it, a Sections tab lets users add a new category with an emoji and a name. New sections appear immediately in the filter tabs and in the section dropdown when adding habits.

Adding a Habit

There should be a plus button at the bottom right of the screen that opens a form for the habit's name, emoji, point value, which section it belongs to, and which days of the week it should appear. All fields except name should be optional with defaults.

Editing Habits

The pencil icon in the header should open a form of task manager, where all habits are shown grouped by section. Users should be able to drag to reorder habits within and across sections, tap a habit to edit any of its properties, bulk-select multiple habits to delete them together, and manage sections separately.

Screen 2 (CHALLENGES)

The Challenges screen should split into two views: Challenges and Friends

Challenges View

Solo challenges should appear as white cards. There should be a mark today complete button too. Moreover, completed and failed challenges should appear below active ones. A + New challenge button in the header opens a modal where users choose a duration (21, 30, 60, or 90 days), a completion rate (50%, 80%, or 100% of habits per day), and optionally which specific habits count toward the challenge. Additionally it should also allow users to customize.

Friends View

Each friend should appear as a card showing their display name, their user code, and three live stats pulled from their public profile. Above the friend list, a pending requests banner should appear when there are unanswered friend requests.

Social Challenges

Friends should be able to challenge each other either on the race or bond modes. Race mode shows independent streaks racing toward the same goal. Bond mode shows a shared streak that resets for both if either person misses a day. A Custom mode should allow users to define their own rules around misses and victory conditions.

Screen 3 (PROGRESS)

Main Card

Should show a circular progress ring showing today's completion percentage, the user's current streak, and a short motivational message that changes based on streak length.

Stats

Four main numbers: Day Streak, Total Points, Best Streak, and Points Spent.

Today's Section Progress

Display each habit section with a thin progress bar indicating how many of that section's habits were completed today.

Weekly Calendar

Should show seven day dots in a horizontal row labeled with day initials. Fully completed days fill with the success green, partially completed days fill with the soft powder color, and missed days stay empty with a warm border. Left and right arrows let users navigate back up to eight previous weeks. Tapping any day dot should open a sheet showing exactly which habits were completed that day, and allowing users to edit past completions.

Habit Streaks

Ranked list at the bottom that shows the top five habits by current consecutive streak, with the streak count.

Screen 4 (REWARDS)

Points Header

Display User's available points at the top.

Your Pleasures Section

User's defined rewards should appear as white cards with the reward's emoji icon in a warm rounded square, its name and point cost, and a redeem button on the right. If the user doesn't have enough points, the button should gray out and display how many more points are needed. Tapping anywhere on the reward card (except redeem) should reveal edit and delete buttons. When a reward is redeemed, a dark snackbar appears at the top of the screen with an undo button and a 10-second countdown, after which the redemption is permanent. Dashed + Add a pleasure button at the bottom of the list.

Purchase History

The history section shows the five most recent transactions by default with point earnings (in green) and redemptions (in red). Include a view more button that loads ten additional entries

at a time. Once all entries are visible, add a collapse history button resets it back to the five most recent.

Features vs. Needs

All features were added by me thinking on user needs, however the description is AI assisted.

Feature	User Need
Habits	Users need a structured way to define the behaviors they want to build into their daily life. Habits are the core data object of the entire system, and everything else (streaks, points, challenges, progress) is derived from whether habits were completed.
+ Button	Users need a fast way to add a new habit in the moment without leaving their current context.
Edit Button	Users need to maintain their habit system over time, reordering habits to match priority, bulk-deleting ones they've abandoned, and reorganizing categories as their life changes.
Habit Filters	Users with habits across multiple life areas need to focus on one category at a time without being overwhelmed by an undifferentiated list.
Challenges	Users need an accountability structure beyond the daily checklist to sustain motivation over longer timeframes. Solo challenges (21-day, 30-day, 90-day) give users a defined arc with a clear finish line, which makes the abstract goal of "being consistent" feel concrete and winnable.
Streak	Users need immediate, visible feedback that consistency is compounding. The streak counter satisfies the psychological need for a numerical proof that showing up every day is adding up.
Point Tracker	Users need a unit of value that converts habit completion into something they can spend, which creates a second motivation loop beyond the streak. Points give users a reason to complete habits.
Weekly view	Users need to see their completion pattern across the full week so they can identify which days they consistently miss and adjust their habits accordingly. Additionally, it enables users to make changes as needed when a day was not logged but still completed.
Rewards and Pleasures	Users need to close the loop between effort and reward in a way that feels personal. By letting users define their own rewards (takeout, spa day, movie night) at their own point values, the system ties habit completion to things the user

	actually wants, making a meaningful point economy.
Purchase History	Users need transparency into how they've spent their points so they can feel the weight of their choices and maintain trust that the system is tracking correctly.
Onboarding Process	Users need to arrive at a personalized, ready-to-use app. The six-screen flow collects theme preference, display name, habit categories, initial habits, and rewards before the user ever reaches the main interface, so the app feels immediately helpful.
Friends	Users need social accountability. The friends system with Race mode (competitive independent streaks) and Bond mode (shared streak where one person's miss affects both) creates external commitment devices, the most reliable known driver of sustained behavior change.
Per-day Habit Scheduling	Users need habits to appear only on the days they're actually applicable, because seeing a gym habit on a rest day creates noise and false failure. Scheduling each habit to specific days of the week means the Today view only shows what the user actually committed to for that day.
Undo Redemption (10-second snackbar)	Users need a safety net against accidental reward redemptions. The 10-second undo window gives users enough time to catch a mistake without making the redemption feel tentative.
Customizable Point Value Per Habit	Users need the point economy to reflect how hard different habits actually are, because a 5-minute journaling habit and a 60-minute workout should not be worth the same. Letting users assign point values means the reward system stays proportional to real effort.
Theme Customization (Blush, Lavender, Mist, Sage)	Users need to feel like the app belongs to them rather than feeling like a generic tool they downloaded. Choosing a color palette during onboarding creates immediate personal ownership before the user has done anything else.
Time-of-Day Greeting	Users need the Today screen to feel alive and contextual rather than static. The greeting changes between Good morning, Good afternoon, and Good evening based on the current hour, which signals that the app is aware of where the user is in their day.
Drag-to-Dismiss Modals	Users need bottom sheet modals to behave like native mobile sheets they already know how to use. The drag handle at the top of every modal satisfies the expectation that you can swipe down to dismiss rather than needing to find a close button.
Active Challenge Banner on Today	Users need a persistent reminder of their active challenges without having to navigate to a separate tab. The banner on the Today page showing how many active challenges the user

	has keeps the challenge system present as a daily motivator rather than something they forget about between visits.
--	---

Onboarding Process

The onboarding process should allow users to smoothly customize their UI while understanding what the app does and how it does it.

Flow

1. Select colors
2. Select Username
3. Ask user what they want to work on (Categories)
4. Suggestions (Habits)
5. Add rewards + suggested
6. Launch guided tour

It should always allow the user to skip the process and go back.

Pivot

Remove the dinosaur completely and replace it with challenges that the user can make + enabling an option to connect with friends. Additionally, people can either compete with friends for who gets the longest streak or join a friend in a challenge, where if one loses their streak, they both will. This way, the motivation to use the game is stronger and the pet is not just sitting there.

App Annotations

✓ Edits: 1. Abajo ya tiene un plus sign, so el ícono de lápiz arriba debería ser para editar todos mis tasks, donde puedo mover el orden de mis tasks, y seleccionar varios para borrarlos, etc.

✓ Pet interactions: Overall pet can die if you don't keep consistency y para revivirlo toma mucho

✓ Add a way to edit how many points a task gives me.

✓ Onboarding: Welcome to the platform for consistent habits. Introduce dino and explain what happens to it. This is not a todo list

✓ Cambiar la palabra task por habit

Improve drag and drop on mobile para el reorder

✓ Change the UI when user first begins using the app Maybe done la vdd no sé

✓ Join friends for mutual motivation or compete with friends

✓ Remember me checkbox

✓ Fix bug for sections created by user vs. default

✓ Rewards screen: Condense history + collapse again when user opens it.

English and Spanish Options

✓ Dinosaur is still not green

✓ light mode is not working and dark is set to default

✓ Whenever there's a popup tab, it should be able to close by dragging the small bar on top

✓ Allow users to select days of the week where they want to add a habit (default all)

✓ Allow users to go back and check from previous days

✓ Allow users to edit the rewards elements

✓ Edit all your habits screen

✓ Fix bug with specific day habits

✓ Fix best streak tab on dino screen

✓ Add arrows to view previous weeks. Example: If I were to forget on a sunday and it's monday, I should be able to go back

Fix shortcut error for app icon

✓ Undo redeem??

✓ Add challenges for users to follow with their own thing and give medals to the dino when completed ex. 21 day challenge, 30 day challenge, 3 month challenge/90day challenge, etc. can also be joined with friends.

Fix remember me button because it is not actually remembering the user

✓ The UI looks a little busy on the home screen, so change it to make it less crowded.

✓ Change remember me box color

✓ Fix bug in bottom menu

✓ Asking user what to add for tasks and pleasures.

✓ Allow to delete a habit when viewing all habits

Allow users to choose also a day of the month where they would want to add a habit.

✓ Editable characters for the pet, choose a name to give it more emotional appeal and cause more addiction to the game. Maybe keep it as a dinosaur for brand identity, but make it so that the user can change the color, the name and other visual elements to make them theirs. We want the user to completely fall in love with the pet to give it motivation to use this app and want to keep the dinosaur alive.

✓ Fix onboardding bug

✓ Fix top of the screen color

✓ Fix bug with color

✓ Change Colors

✓ Would you recommend the following feature? 3 different modes of playing. In easy, completion of all tasks gives you points, your dinosaur dies after 3 days of completing none of your habits. The middle is that the points only add up if you complete all habits of the section, and the dinosaur dies after 3 days of completing less than 50% of the habits. Then the hard mode is that the points only add up if you complete all of your habits for the day, and your dinosaur dies after three days of completing less than 100% of the tasks. Or is it too overwhelming for users? How would you incorporate this dinosaur life thing while changing the existing one but making it very clean and user firendly? (point being I want to give more protagonism to the pet regardless of if the 3 modalities are incorporated)

✓ Maybe change how the dinosaur looks, idk if I like it

- ✓ Dinosaur should look at user
- ✓ Specify what habits were completed in the tacker
- ✓ Fix onboarding bug
- ✓ Fix responsive button bug
- ✓ Fix delete account bug
- ✓ Onboarding should also ask users to customize their rewards and further explain how it works
- ✓ Fix loading screen bug
- ✓ Clean up onboarding process
- ✓ Add back arrows during onboarding process

Desktop version vs. mobile

- ✓ Increase all font sizes by 2pt
- ✓ Default General Category
- ✓ Merge reorder and bulk edit
- ✓ Get rid of dinosaur
- ✓ Does not let me go to previous weeks bug
- ✓ Change heading font
- ✓ Change emojis for icons
- ✓ Fix username bug
- ✓ Fix spacing error
- ✓ When an account is deleted, friends can still see it in their friend list.
- ✓ Fix matching days
- ✓ Fix plus sign
- ✓ Review order of my menu

✓ Revise account and settings screen

✓ Fix all onboarding bugs on desktop: I need a prompt for claude code to fix my onboarding process (ONLY FOR THE DESKTOP VERSION OF MY APP. DO NOT CHANGE UNDER ANY CIRCUMSTANCE THE MOBILE). It should look like my other prompts in this project. The issue right now is that everything other than my onboarding is consistent. All the content is fit to a set rounded rectangle that was created for consistency, and for some reason, the onboarding is not. The onboarding should not allow the user to view the side menu. It should cover it but fitting exactly the rounded rectangle container. Additionally, if the user scrolls, they can see a portion of the account settings. For the username, it should be centered both vertically and horizontally across the rounded rectangle container. Same with all the customization screens. Finally the guided tutorial is not working at all. For starters, It does not display what the user needs to see highlighted with a border. Additionally, it is applying the low exposure filter to everything, so it does not pop out. Moreover, the order is not correct and it is highlighting the wrong thing while the text says other. For example, track new progress while the outline is on today. Set challenges while the outline is in progress. Your rewards store while the outline is in challenges And finally your daily rituals while the outline is on rewards. Also, the guided tour should include a button for users to see the: "Add habit" and where to also edit the habits, etc. Help me fix this without messing up the style of anything unrelated to onboarding and most importantly without messing the mobile version

Fix onboarding mismatch on mobile

Fix challenge bug

5 Questions

Yes, I can defend every decision in this project. One of my first choices was the choice to use vanilla JS over React. Additionally, the global ``state`` object as a single source of truth, the ``save()`` → ``updateAll()`` loop as the equivalent of props-down/events-up, and the three-panel architecture mapped to Today (Browser), Progress (Detail View), and Task Manager (Controller). This design is completely mine. Throughout the entire process, I've made annotations for changes within the app, examples including the decision to remove the dinosaur after building it, pivoting to a social challenge system, directing the reward economy, specifying per-day habit scheduling, and rejecting difficulty modes AI built. These are all choices that came from me, and I have the annotation history and records of resistance to demonstrate it. I verified the cross-panel state sharing by completing habits on Today and watching the streak counter, points total, and progress ring update simultaneously without any panel storing its own copy of the data. I could explain the pattern to a classmate in the following way: when you tap a habit, ``toggleTask()`` updates ``state.completedDays``, ``save()`` writes it to Firestore, and ``updateAll()`` calls every render function, they all read from the same ``state``, so they all reflect the change at once. And my documentation is honest, including one gap between my work and the class instructions: my Detail View is time-based rather than item-based, meaning the "selected item" is a week offset rather than a habit ID, which is a deliberate architectural choice I made when I decided the Progress screen should show aggregate history rather than detailing a single habit.
